Reservoir Engineering | SCAL | Enhanced Oil Recovery

Open to Work

komasisaeeedeh@gmail.com

About Me

I enjoy understanding the underlying causes of phenomena and solving complex problems rather than simply performing routine tasks. When faced with inconsistent data or unexpected results, I do not accept them at face value; instead, I investigate the root causes and strive to reach reliable conclusions through a combination of experimentation, simulation, and data analysis. I am a fast learner with strong analytical thinking, high attention to detail, and a keen interest in research and development projects as well as reservoir engineering studies.

Education

M.Sc. in Petroleum Engineering
Iran University of Science and Technology, Tehran, Iran | 2019–2022

GPA: 18.79/20

Admitted through the Exceptional Talents Program

B.Sc. in Petroleum Engineering
Shiraz University, Shiraz, Iran | 2015–2019

GPA: 17.44/20

Honors and Awards

Admitted to the M.Sc. Petroleum Engineering program at Iran University of Science and Technology through the Exceptional Talents Program.

Ranked 2nd among M.Sc. Petroleum Engineering classmates.

Ranked among the top 15% of undergraduate entrants.

Skills

EOR	Floviz
Spontaneous imbibition	Pvti
Simulation	Matlab
Relative permeability	Phreeqc
Capillary pressure	Cydar
Laboratory QC	Eclipse E100
Contact angle	Pipesim
HPHT IFT

Work Experience

PetroVision Pasargad

Research & Development Specialist | 2023–2026

Conducted reservoir studies to identify the most suitable injection water and minimize scale formation risks in one of Iran's oil fields. Evaluated various water injection scenarios based on reservoir conditions.

- Performed formation water and seawater compatibility studies in the presence of reservoir rock.
- Developed simulation models using Phreeqc and OLI software.
- Interpreted geochemical results and predicted carbonate and sulfate scale formation.
- Designed laboratory testing programs for result validation and risk assessment.

Analyzed and interpreted relative permeability and capillary pressure data obtained from centrifuge experiments.

- Identified unrealistic relative permeability curves, abnormal saturation values, and noisy datasets.
- Generated relative permeability versus saturation curves.

Prepared technical reports and documented project results.

Institute of Enhanced Oil Recovery, IUST

Researcher | 2019–2022

Contributed to the design and execution of spontaneous imbibition experiments to evaluate the performance of enhanced oil recovery (EOR) methods in one of Iran's largest oil fields.

- Performed core cleaning using a Soxhlet extraction apparatus in accordance with laboratory standards.
- Conducted vacuum core saturation for laboratory sample preparation.
- Carried out core aging processes to restore reservoir conditions.
- Prepared core samples, including cutting, labeling, dimensional measurements, and sample preparation for laboratory testing.
- Executed complete spontaneous imbibition experiments for multiple water samples.
- Analyzed laboratory results and prepared technical reports.

Research Project

Synthesis and Evaluation of a Salinity-Resistant Natural Surfactant for Enhanced Oil Recovery from a Tight Carbonate Reservoir

- Extracted and produced a natural surfactant.
- Designed and conducted complete spontaneous imbibition experiments.
- Prepared core samples, crude oil, and laboratory solutions.
- Compared the performance of the synthesized surfactant with low-salinity water and conventional surfactants.
- Achieved approximately a 30% increase in oil recovery factor compared with the reference condition.
- Analyzed laboratory results and evaluated the mechanisms responsible for improving oil recovery.
